sbt , (terminal encoding),HTTP ,JVM

macOS sbt

ZIP TGZ

: ,

Homebrew

```
$ brew install sbt
```

SDKMAN!

```
$ sdk install sbt
```

Windows sbt

ZIP TGZ

Windows

msi

: ,

Scoop

```
$ scoop install sbt
```

Linux sbt

Installing from SDKMAN

To install both JDK and sbt, consider using SDKMAN.

```
$ sdk list java
$ sdk install java 11.0.4.hs-adpt
$ sdk install sbt
```

This has two advantages. 1. It will install the official packaging by AdoptOpenJDK, as opposed to the "mystery meat OpenJDK builds". 2. It will install `tgz` packaging of sbt that contains all JAR files. (DEB and RPM packages do not to save bandwidth)

ZIP TGZ

Ubuntu Debian

DEB sbt

Ubuntu Debian DEB , DEB , , (`apt-get`,`aptitude`) (Synaptic) `sbt`(, `sudo`)

```
echo "deb https://dl.bintray.com/sbt/debian /" | sudo tee -a /etc/apt/sources.list.d/sbt.list
curl -sL "https://keyserver.ubuntu.com/pks/lookup?op=get&search=0x2EE0EA64E40A89B84B2DF73499
sudo apt-get update
sudo apt-get install sbt
```

hello , `hello/build.sbt`,`hello/bar/build.sbt` `hello/foo/build.sbt` (`version := "0.6"`) sbt `show version` ( ):

```
> show version
[info] hello-foo/*:version
[info]  0.7
[info] hello-bar/*:version
[info]  0.9
[info] hello/*:version
[info]  0.5
```

`hello-foo/*:version` `hello/foo/build.sbt` ,`hello-bar/*:version` `hello/bar/build.sbt` ,`hello/*:version` `hello/build.sbt` scoped keys `version` key scope , `build.sbt` `build.sbt`

Style choices:

- Each subproject's settings can go into `*.sbt` files in the base directory of that project, while the root `build.sbt` declares only minimum project declarations in the form of `lazy val foo = (project in file("foo"))` without the settings.

- We recommend putting all project declarations and settings in the root `build.sbt` file in order to keep all build definition under a single file. However, it up to you.
